

Objective:

To demonstrate classcastexception

Execution Steps:

STEP 1:

Open IntelliJ IDEA.

STEP 2:

Create a Java project.

STEP 3:

Create a package named:

javacore

STEP 4:

Create a Java class named:

ClassCastException

STEP 5:

Write the given program in the class.

STEP 6:

Save the program.

STEP 7:

Compile the program.

STEP 8:

Run the program.

STEP 9:

The program starts execution from the main() method.

STEP 10:

The statement

Object value = "Hello";

stores the String "Hello" in the Object variable.

STEP 11:

The try block starts executing.

STEP 12:

The statement

Integer number = (Integer) value;

tries to convert the String object into an Integer.

STEP 13:

The conversion is invalid, so ClassCastException occurs.

STEP 14:

The catch block handles the exception.

STEP 15:

"Class Cast Exception" is displayed.

STEP 16:

"Program ended" is displayed.

STEP 17:

The program ends.

Algorithm:

1. Start the program.
2. Create an Object variable named value and store the String "Hello".
3. Start the try block.
4. Try to type-cast the String object into an Integer object.
5. Since String cannot be converted into Integer using this cast,
ClassCastException occurs.
6. Catch the ClassCastException using the catch block.
7. Display "Class Cast Exception".
8. Display "Program ended".
9. Stop the program.

1. Start the program.
2. Create an Object variable named value and store the String "Hello".
3. Start the try block.
4. Try to type-cast the String object into an Integer object.
5. Since String cannot be converted into Integer using this cast,
ClassCastException occurs.
6. Catch the ClassCastException using the catch block.

7. Display "Class Cast Exception".

8. Display "Program ended".

9. Stop the program.

UML Class Diagram:

```
|                                     |
+-----+
| + ClassCastException()             |
+-----+
```

Output:

Class Cast Exception

Program ended
